

[Lecture - 10]

npx tailwind init → it make
tailwind.config.js

Date.....

- Styled - Component
- SASS, SCSS
- Material UI
- Chakra UI
- Ant Design → 2nd most popular react UI lib

→ PostCSS - It is a tool for transforming CSS with JS.

→ tailwind.config.js - It is a configuration for tailwind

• postcssrc - It is a configuration for postcss

↓

{

"plugins": [

"tailwindcss": {}

],

}

We have to tell postcssrc that we are using tailwind

→ Our bundler will use postcssrc to understand tailwind.

So, postcssrc is a way that our project understand what is written inside tailwind

~~tailwind.config.js~~ →

```
@type {import('tailwindcss').Config}
```

```
module.exports = {
```

```
  content: ["/src/**/*.{html,js,ts,jsx,tsx}"],
```

↓
This content attribute takes an array of list of all files where we can use of tailwind CSS.

→ we can remove ts, jsx & tsx.

we have to write in index.css

@tailwind base

@tailwind components

@tailwind utilities

→ we are kind of importing our tailwind CSS into our CSS file

→ Now we will not be touching index.css file.
